Question **1**

Complete

Mark 0.00 out of 1.00

Select the sequence of events that are NOT possible, assuming an interruptible kernel code

Select one or more:

a. P1 running
keyboard hardware interrupt
keyboard interrupt handler running
interrupt handler returns
P1 running
P1 makes sytem call
system call returns
P1 running
timer interrupt
scheduler
P2 running

b. P1 running
P1 makes sytem call and blocks
Scheduler
P2 running
P2 makes sytem call and blocks
Scheduler
P3 running
Hardware interrupt
Interrupt unblocks P1
Interrupt returns
P3 running
Timer interrupt
Scheduler
P1 running

c.
P1 running
P1 makes sytem call
Scheduler
P2 running
P2 makes sytem call and blocks
Scheduler
P1 running again

d. P1 running
P1 makes system call
timer interrupt
Scheduler
P2 running
timer interrupt
Scheuler
P1 running
P1's system call return

e. P1 running
P1 makes system call
system call returns
P1 running
timer interrupt
Scheduler running
P2 running

f. P1 running
P1 makes sytem call and blocks
Scheduler
P2 running

P2 makes sytem call and blocks
Scheduler
P1 running again

The correct answers are: P1 running
P1 makes sytem call and blocks
Scheduler
P2 running
P2 makes sytem call and blocks
Scheduler
P1 running again,
P1 running
P1 makes sytem call
Scheduler
P2 running
P2 makes sytem call and blocks
Scheduler
P1 running again

Question **2**

Complete

Mark 0.88 out of 1.00

Consider the image given below, which explains how paging works.

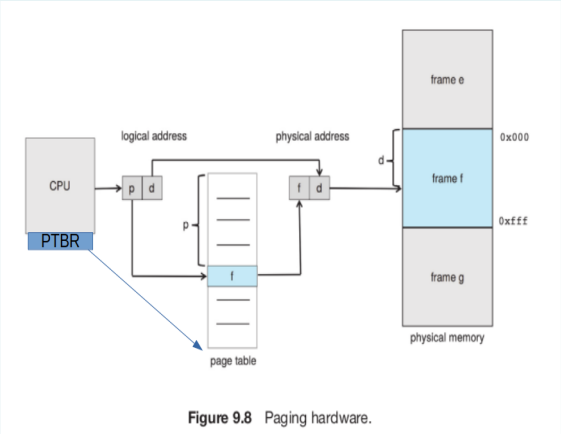

Figure 9.8 Paging hardware.

Mention whether each statement is True or False, with respect to this image.

True	False	
◉	○	Maximum Size of page table is determined by number of bits used for page number
○	◉	Size of page table is always determined by the size of RAM
○	◉	The page table is indexed using frame number
◉	○	The page table is itself present in Physical memory
◉	○	The page table is indexed using page number
◉	○	The locating of the page table using PTBR also involves paging translation
◉	○	The PTBR is present in the CPU as a register
◉	○	The physical address may not be of the same size (in bits) as the logical address

Maximum Size of page table is determined by number of bits used for page number: True
Size of page table is always determined by the size of RAM: False
The page table is indexed using frame number: False
The page table is itself present in Physical memory: True
The page table is indexed using page number: True
The locating of the page table using PTBR also involves paging translation: False
The PTBR is present in the CPU as a register: True
The physical address may not be of the same size (in bits) as the logical address: True

Question **3**

Complete

Mark 1.00 out of 1.00

A process blocks itself means

- a. The kernel code of system call calls scheduler
- b. The kernel code of an interrupt handler, moves the process to a waiting queue and calls scheduler
- c. The kernel code of system call, called by the process, moves the process to a waiting queue and calls scheduler
- d. The application code calls the scheduler

The correct answer is: The kernel code of system call, called by the process, moves the process to a waiting queue and calls scheduler

Question **4**

Complete

Mark 0.75 out of 1.00

Which of the following are NOT a part of job of a typical compiler?

- [x] a. Invoke the linker to link the function calls with their code, extern globals with their declaration
- [ ] b. Check the program for syntactical errors
- [ ] c. Convert high level langauge code to machine code
- [x] d. Check the program for logical errors
- [x] e. Suggest alternative pieces of code that can be written
- [ ] f. Process the # directives in a C program

The correct answers are: Check the program for logical errors, Suggest alternative pieces of code that can be written

Question **5**

Complete

Mark 0.00 out of 1.00

Select the sequence of events that are NOT possible, assuming a non-interruptible kernel code

(Note: non-interruptible kernel code means, if the kernel code is executing, then interrupts will be disabled).

Note: A possible sequence may have some missing steps in between. An impossible sequence will will have n and n+1th steps such that n+1th step can not follow n'th step.

Select one or more:

a. P1 running
P1 makes sytem call and blocks
Scheduler
P2 running
P2 makes sytem call and blocks
Scheduler
P1 running again

b. P1 running
P1 makes sytem call and blocks
Scheduler
P2 running
P2 makes sytem call and blocks
Scheduler
P3 running
Hardware interrupt
Interrupt unblocks P1
Interrupt returns
P3 running
Timer interrupt
Scheduler
P1 running

c. P1 running
P1 makes system call
system call returns
P1 running
timer interrupt
Scheduler running
P2 running

d. P1 running
keyboard hardware interrupt
keyboard interrupt handler running
interrupt handler returns
P1 running
P1 makes sytem call
system call returns
P1 running
timer interrupt
scheduler
P2 running

e. P1 running
P1 makes system call
timer interrupt
Scheduler
P2 running
timer interrupt
Scheuler
P1 running
P1's system call return

f.

P1 running
P1 makes sytem call
Scheduler
P2 running
P2 makes sytem call and blocks
Scheduler
P1 running again

The correct answers are: P1 running
P1 makes sytem call and blocks
Scheduler
P2 running
P2 makes sytem call and blocks
Scheduler
P1 running again, P1 running
P1 makes system call
timer interrupt
Scheduler
P2 running
timer interrupt
Scheuler
P1 running
P1's system call return,
P1 running
P1 makes sytem call
Scheduler
P2 running
P2 makes sytem call and blocks
Scheduler
P1 running again

Question **6**

Complete

Mark 4.25 out of 5.00

Following code claims to implement the command

/bin/ls -l | /usr/bin/head -3 | /usr/bin/tail -1

Fill in the blanks to make the code work.

Note: Do not include space in writing any option. x[1][2] should be written without any space, and so is the case with [1] or [2]. Pay attention to exact syntax and do not write any extra character like ';' or = etc.

```
int main(int argc, char *argv[]) {
   int pid1, pid2;
   int pfd[
```
[2]
```
][2];

   pipe(
```
[pfd[0]]
```
);
   pid1 =
```
[fork()]
```
;
   if(pid1 != 0) {
      close(pfd[0]
```
[[0]]
```
);
      close(
```
[1]
```
);
      dup(
```
[pfd[0][1]]
```
);
      execl("/bin/ls", "/bin/ls", "
```
[-l]
```
", NULL);
   }
   pipe(
```
[pfd(1)]
```
);

```
[pid2]
```
= fork();
   if(pid2 == 0) {
      close(
```
[pfd[0][1]]
```
;
      close(0);
      dup(
```
[pfd[0][0]]
```
);
      close(pfd[1]
```
[[0]]
```
```

```
);
        close(
1
);
        dup(
pfd[1][1]
);
        execl("/usr/bin/head", "/usr/bin/head", "
-3
", NULL);
    } else {
        close(pfd
[1][1]
);
        close(
0
);
        dup(
pfd[1][0]
);
        close(pfd
[1][0]
);
        execl("/usr/bin/tail", "/usr/bin/tail", "
-1
", NULL);
    }
}
```

Question **7**

Complete

Mark 0.80 out of 1.00

Select all the correct statements about zombie processes

Select one or more:

- [ ] a. Zombie processes are harmless even if OS is up for long time
- [ ] b. If the parent of a process finishes, before the process itself, then after finishing the process is typically attached to 'init' as parent
- [x] c. A process becomes zombie when it finishes, and remains zombie until parent calls wait() on it
- [ ] d. A process becomes zombie when it's parent finishes
- [x] e. A process can become zombie if it finishes, but the parent has finished before it
- [x] f. init() typically keeps calling wait() for zombie processes to get cleaned up
- [ ] g. A zombie process remains zombie forever, as there is no way to clean it up
- [x] h. A zombie process occupies space in OS data structures

The correct answers are: A process becomes zombie when it finishes, and remains zombie until parent calls wait() on it, A process can become zombie if it finishes, but the parent has finished before it, A zombie process occupies space in OS data structures, If the parent of a process finishes, before the process itself, then after finishing the process is typically attached to 'init' as parent, init() typically keeps calling wait() for zombie processes to get cleaned up

Question **8**

Complete

Mark 1.00 out of 1.00

Select the state that is not possible after the given state, for a process:

New: Running

Ready : Waiting

Running: : None of these

Waiting: Running

Question **9**

Complete

Mark 0.71 out of 1.00

Consider the following code and MAP the file to which each fd points at the end of the code.

```
int main(int argc, char *argv[]) {
   int fd1, fd2 = 1, fd3 = 1, fd4 = 1;

   fd1 = open("/tmp/1", O_WRONLY | O_CREAT, S_IRUSR|S_IWUSR);
   fd2 = open("/tmp/2", O_RDDONLY);
   fd3 = open("/tmp/3", O_WRONLY | O_CREAT, S_IRUSR|S_IWUSR);
   close(0);
   close(1);
   dup(fd2);
   dup(fd3);
   close(fd3);
   dup2(fd2, fd4);
   printf("%d %d %d %d\n", fd1, fd2, fd3, fd4);
   return 0;
}
```

fd4 None of these

fd3 closed

fd2 /tmp/3

1 /tmp/3

fd1 /tmp/1

0 /tmp/2

2 stderr

The correct answer is: fd4 → /tmp/2, fd3 → closed, fd2 → /tmp/2, 1 → /tmp/3, fd1 → /tmp/1, 0 → /tmp/2, 2 → stderr

Question **10**

Complete

Mark 0.50 out of 1.00

Select the compiler's view of the process's address space, for each of the following MMU schemes:
(Assume that each scheme,e.g. paging/segmentation/etc is effectively utilised)

Segmentation, then paging	Many continuous chunks each of page size
Segmentation	many continuous chunks of variable size
Paging	Many continuous chunks of same size
Relocation + Limit	one continuous chunk

The correct answer is: Segmentation, then paging → many continuous chunks of variable size, Segmentation → many continuous chunks of variable size, Paging → one continuous chunk, Relocation + Limit → one continuous chunk

Question **11**

Complete

Mark 0.00 out of 1.00

Select all the correct statements about named pipes and ordinary(unnamed) pipe

Select one or more:

- [x] a. named pipes can be used between multiple processes but ordinary pipes can not be used
- [x] b. named pipe can be used between any processes
- [x] c. named pipes are more efficient than ordinary pipes
- [ ] d. named pipe exists even if the processes using it do exit()
- [x] e. ordinary pipe can only be used between related processes
- [ ] f. both named and unnamed pipes require some kind of agreed protocol to be effectively used among multiple processes
- [x] g. a named pipe exists as a file on the file system

The correct answers are: ordinary pipe can only be used between related processes, named pipe can be used between any processes, a named pipe exists as a file on the file system, named pipe exists even if the processes using it do exit(), both named and unnamed pipes require some kind of agreed protocol to be effectively used among multiple processes

Question **12**

Complete

Mark 0.20 out of 1.00

Consider the two programs given below to implement the command (ignore the fact that error checks are not done on return values of functions)

$ ls . /tmp/asdfksdf >/tmp/ddd 2>&1

Program 1

```
int main(int argc, char *argv[]) {
    int fd, n, i;
    char buf[128];

    fd = open("/tmp/ddd", O_WRONLY | O_CREAT, S_IRUSR | S_IWUSR);
    close(1);
    dup(fd);
    close(2);
    dup(fd);
    execl("/bin/ls", "/bin/ls", ".", "/tmp/asldjfaldfs", NULL);
}
```

Program 2

```
int main(int argc, char *argv[]) {
    int fd, n, i;
    char buf[128];

    close(1);
    fd = open("/tmp/ddd", O_WRONLY | O_CREAT, S_IRUSR | S_IWUSR);
    close(2);
    fd = open("/tmp/ddd", O_WRONLY | O_CREAT, S_IRUSR | S_IWUSR);
    execl("/bin/ls", "/bin/ls", ".", "/tmp/asldjfaldfs", NULL);
}
```

Select all the correct statements about the programs

Select one or more:

- [ ] a. Program 2 makes sure that there is one file offset used for '2' and '1'
- [ ] b. Program 1 ensures 2>&1 and does not ensure > /tmp/ddd
- [x] c. Program 1 makes sure that there is one file offset used for '2' and '1'
- [ ] d. Both program 1 and 2 are incorrect
- [x] e. Program 1 is correct for > /tmp/ddd but not for 2>&1
- [ ] f. Program 2 does 1>&2
- [ ] g. Only Program 2 is correct
- [ ] h. Program 2 is correct for > /tmp/ddd but not for 2>&1
- [x] i. Program 1 does 1>&2
- [ ] j. Only Program 1 is correct
- [x] k. Both programs are correct
- [ ] l. Program 2 ensures 2>&1 and does not ensure > /tmp/ddd

The correct answers are: Only Program 1 is correct, Program 1 makes sure that there is one file offset used for '2' and '1'

Question **13**

Complete

Mark 0.71 out of 1.00

Order the events that occur on a timer interrupt:

Jump to scheduler code	4
Save the context of the currently running process	1
Select another process for execution	5
Set the context of the new process	6
Change to kernel stack of currently running process	3
Execute the code of the new process	7
Jump to a code pointed by IDT	2

The correct answer is: Jump to scheduler code → 4, Save the context of the currently running process → 3, Select another process for execution → 5, Set the context of the new process → 6, Change to kernel stack of currently running process → 1, Execute the code of the new process → 7, Jump to a code pointed by IDT → 2

Question **14**

Complete

Mark 1.60 out of 2.00

Match the elements of C program to their place in memory

#include files	No memory needed
Global variables	Data
Global Static variables	Data
Malloced Memory	Heap
Code of main()	Main_Code
Function code	Code
Arguments	Stack
#define MACROS	No memory needed
Local Variables	Stack
Local Static variables	Data

The correct answer is: #include files → No memory needed, Global variables → Data, Global Static variables → Data, Malloced Memory → Heap, Code of main() → Code, Function code → Code, Arguments → Stack, #define MACROS → No Memory needed, Local Variables → Stack, Local Static variables → Data

Question **15**

Complete

Mark 1.00 out of 1.00

Select the order in which the various stages of a compiler execute.

Syntatical Analysis	2
Pre-processing	1
Linking	4
Loading	does not exist
Intermediate code generation	3

The correct answer is: Syntatical Analysis → 2, Pre-processing → 1, Linking → 4, Loading → does not exist, Intermediate code generation → 3
